Solving Systems of Equations

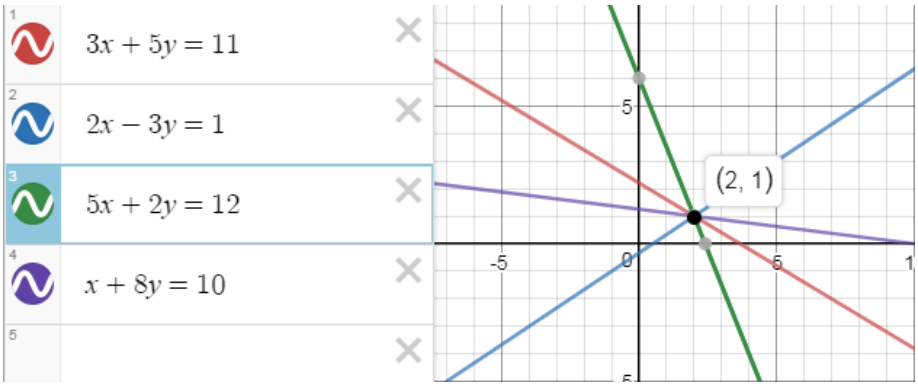

Recall: Two Methods:

1. _____
2. _____

Example 1: Solve the system.

$$3x+5y=11$$
$$2x-3y=1$$

Note: To solve a system by elimination, we replace the original system with a new _____ system that has the same solution.

To create equivalent system, you may replace any equation with:

1. a _____ _____ of itself
2. a _____ _____ of itself and any other equation

Example 2: Solve the following system.

$$x + 2y - 4z = -7$$
$$2x + 5y - z = 9$$
$$3x - y + 2z = 7$$

Example 3: Solve the following system.

$$3x + 5y - z = 6$$
$$2x + y + 4z = 4$$
$$6x + 10y - 2z = 12$$
